Figure 48

Action when clicking on an arrow head

When the arrow was drawn an arrow logic object was created. When the arrow head is clicked, a routine is called in the arrow logic to analyze what to do with the arrow.

set the type of logic from the color of the arrow
(red = control from)

keep the arrow logic in memory to create a connection between the source objects and the target. Whenever value changes happen in the source objects, the arrow logic receives a notification of the event

Then
done

Clicking on a switch in an arrow logic

Figure 49

When a switch is clicked and the switch is in an arrow logic, a routine is called in the arrow logic
